

SECON[®]-X

The advanced pipe system for today's gas stations

Creating S-Curves Just Comes Naturally To Our SECON[®]-X Double Wall Pipe

Actually, a snake is really nothing more than a double-wall pipe with a strong inner member (*a spinal column*) and a pliable outer layer (*muscle*). This allows it to flex and handle tight bends.

SECON-X uses the same idea by combining a helically corrugated stainless steel primary pipe with a LDPE/PA secondary casing into one highly flexible, double-wall pipe. The benefit? Plastic pipes snap back when they are bent. However the corrugated steel inner pipe of **SECON-X** lets you handle S-Curves

and obstacles with ease without springing back. UL Listed, seamless, joint-free — **SECON-X** just outclasses the rest.

Like a snake **SECON-X** has only two fittings per run. Which means it installs fast and has less potential for leaks.

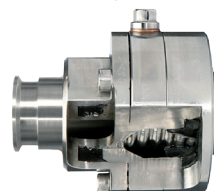

But its stainless steel construction isn't affected by temperature — which gives it a big advantage over its cold-blooded cousin.

Used for over 30 years and in thousands of installations, **SECON-X** has proven itself to be the most cost-effective, flexible pipe for gas station applications today.

Next time you have to snake around a gas station, think about all the advantages that **SECON-X** offers. We think you'll be highly tempted.

End fitting
with NPT thread

End fitting with
EZ-Fit connector
